1.1. MkDocs

Project documentation with Markdown.

MkDocs is a **fast, simple** and **downright gorgeous** static site generator that's geared towards building project documentation. Documentation source files are written in Markdown, and configured with a single YAML configuration file. Start by reading the [introductory tutorial](#), then check the [User Guide](#) for more information.

[Getting Started](#) [User Guide](#)

1.1.1. Features

1.1.1.1. Great themes available

There's a stack of good looking [themes](#) available for MkDocs. Choose between the built in themes: [mkdocs](#) and [readthedocs](#), select one of the third-party themes listed on the [MkDocs Themes](#) wiki page, or [build your own](#).

1.1.1.2. Easy to customize

Get your project documentation looking just the way you want it by [customizing your theme](#) and/or installing some [plugins](#). Modify Markdown's behavior with [Markdown extensions](#). Many [configuration options](#) are available.

1.1.1.3. Preview your site as you work

The built-in dev-server allows you to preview your documentation as you're writing it. It will even auto-reload and refresh your browser whenever you save your changes.

1.1.1.4. Host anywhere

MkDocs builds completely static HTML sites that you can host on GitHub pages, Amazon S3, or [anywhere](#) else you choose.

1.2. Getting Started with MkDocs

An introductory tutorial!

1.2.1. Installation

To install MkDocs, run the following command from the command line:

```
pip install mkdocs
```

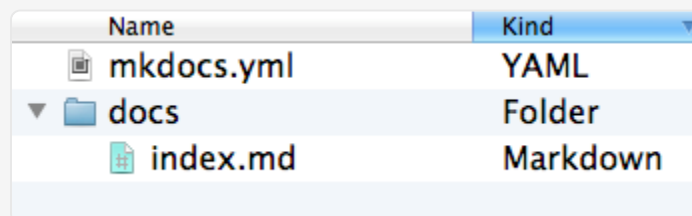

For more details, see the [Installation Guide](#).

1.2.2. Creating a new project

Getting started is super easy. To create a new project, run the following command from the command line:

```
mkdocs new my-project  
cd my-project
```

Take a moment to review the initial project that has been created for you.

Name	Kind
mkdocs.yml	YAML
docs	Folder
index.md	Markdown

Figure 1 - The initial MkDocs layout

There's a single configuration file named `mkdocs.yml`, and a folder named `docs` that will contain your documentation source files (`docs` is the default value for the `docs_dir` configuration setting). Right now the `docs` folder just contains a single documentation page, named `index.md`.

MkDocs comes with a built-in dev-server that lets you preview your documentation as you work on it. Make sure you're in the same directory as the `mkdocs.yml` configuration file, and then start the server by running the `mkdocs serve` command:

```
1 $ mkdocs serve
2 INFO - Building documentation...
3 INFO - Cleaning site directory
4 [I 160402 15:50:43 server:271] Serving on http://127.0.0.1:8000
5 [I 160402 15:50:43 handlers:58] Start watching changes
6 [I 160402 15:50:43 handlers:60] Start detecting changes
7 [I 160402 15:50:43 handlers:58] Start watching changes
8 [I 160402 15:50:43 handlers:60] Start detecting changes
9 [I 160402 15:50:43 handlers:58] Start watching changes
10 [I 160402 15:50:43 handlers:60] Start detecting changes
11 [I 160402 15:50:43 handlers:58] Start watching changes
12 [I 160402 15:50:43 handlers:60] Start detecting changes
13 [I 160402 15:50:43 handlers:58] Start watching changes
14 [I 160402 15:50:43 handlers:60] Start detecting changes
```

Listing 1 - Code with lines numbers and lines highlighted

Open up `http://127.0.0.1:8000/` in your browser, and you'll see the default home page being displayed:

Figure 2 - The MkDocs live server

The `dev-server` also supports auto-reloading, and will rebuild your documentation whenever anything in the configuration file, documentation directory, or theme directory changes.

```
$ mkdocs serve
INFO - Building documentation...
INFO - Cleaning site directory
[I 160402 15:50:43 server:271] Serving on http://127.0.0.1:8000
[I 160402 15:50:43 handlers:58] Start watching changes
[I 160402 15:50:43 handlers:60] Start detecting changes
[I 160402 15:50:43 handlers:58] Start watching changes
[I 160402 15:50:43 handlers:60] Start detecting changes
[I 160402 15:50:43 handlers:58] Start watching changes
[I 160402 15:50:43 handlers:60] Start detecting changes
[I 160402 15:50:43 handlers:58] Start watching changes
[I 160402 15:50:43 handlers:60] Start detecting changes <halt>
[I 160402 15:50:43 handlers:58] Start watching changes >
[I 160402 15:50:43 handlers:60] Start detecting changes >
```

Listing 2 - Direct HTML `pre code mark` with classes to highlight a part of code

Open the `docs/index.md` document in your text editor of choice, change the initial heading to `MkLorum`, and save your changes. Your browser will auto-reload and you should see your updated documentation immediately.

Now try editing the configuration file: `mkdocs.yml`. Change the `site_name` setting to `MkLorum` and save the file.

```
site_name: MkLorum
site_url: https://example.com/
```

Your browser should immediately reload, and you'll see your new site name take effect.

Figure 3 - The `site_name` setting

Note

The `site_name` and `site_url` configuration options are the only two required options in your configuration file. When you create a new project, the `site_url` option is assigned the placeholder value: `https://example.com`. If the final location is known, you can change the setting now to point to it. Or you may choose to leave it alone for now. Just be sure to edit it before you deploy your site to a production server.

1.2.3. Adding pages

Now add a second page to your documentation:

```
curl 'https://jaspervdj.be/lorem-markdownum/markdown.txt' > docs/about.md
```

As our documentation site will include some navigation headers, you may want to edit the configuration file and add some information about the order, title, and nesting of each page in the navigation header by adding a `nav` setting:

```
site_name: MkLorum
site_url: https://example.com/
nav:
  - Home: index.md
  - About: about.md
```

Save your changes and you'll now see a navigation bar with `Home` and `About` items on the left as well as `Search`, `Previous`, and `Next` items on the right.

Figure 4 - Screenshot

Try the menu items and navigate back and forth between pages. Then click on `Search`. A search dialog will appear, allowing you to search for any text on any page. Notice that the search results include every occurrence of the search term on the site and links directly to the section of the page in which the search term appears. You get all of that with no effort or configuration on your part!

Figure 5 - Screenshot

1.2.4. Theming our documentation

Now change the configuration file to alter how the documentation is displayed by changing the theme. Edit the `mkdocs.yml` file and add a `theme` setting:

```
site_name: MkLorum
site_url: https://example.com/
nav:
  - Home: index.md
  - About: about.md
theme: readthedocs
```

Save your changes, and you'll see the ReadTheDocs theme being used.

Figure 6 - Screenshot

1.2.5. Changing the Favicon Icon

By default, MkDocs uses the **MkDocs favicon** icon. To use a different icon, create an `img` subdirectory in the `docs` directory and copy your custom `favicon.ico` file to that directory. MkDocs will automatically detect and use that file as your favicon icon.

1.2.6. Building the site

That's looking good. You're ready to deploy the first pass of your `MkLorum` documentation. First build the documentation:

```
mkdocs build
```

This will create a new directory, named `site`. Take a look inside the directory:

```
$ ls site
about  fonts  index.html  license  search.html
css    img    js          mkdocs   sitemap.xml
```

Notice that your source documentation has been output as two HTML files named `index.html` and `about/index.html`. You also have various other media that's been copied into the `site` directory as part of the documentation theme. You even have a `sitemap.xml` file and `mkdocs/search_index.json`.

If you're using source code control such as `git` you probably don't want to check your documentation builds into the repository. Add a line containing `site/` to your `.gitignore` file.

```
echo "site/" >> .gitignore
```

If you're using another source code control tool you'll want to check its documentation on how to ignore specific directories.

1.2.7. Other Commands and Options

There are various other commands and options available. For a complete list of commands, use the `--help` flag:

```
mkdocs --help
```

To view a list of options available on a given command, use the `--help` flag with that command. For example, to get a list of all options available for the `build` command run the following:

```
mkdocs build --help
```

1.2.8. Deploying

The documentation site that you just built only uses static files so you'll be able to host it from pretty much anywhere. Simply upload the contents of the entire `site` directory to wherever you're hosting your website from and you're done. For specific instructions on a number of common hosts, see the [Deploying your Docs](#) page.

1.2.9. Getting help

See the [User Guide](#) for more complete documentation of all of MkDocs' features.

To get help with MkDocs, please use the [GitHub discussions](#) or [GitHub issues](#).

2. Bloc de Code

2.1. Les blocs de Code MkDocs

Il y a deux types de blocs de code disponible dans MkDocs Material :

- bloc de code `SuperFences` (extension du parser Markdown de Python)
- bloc de code `HTML`

Références :

- [Material for MkDocs > Code blocks](#)
- [Python-Markdown](#)
- [SuperFences](#)

2.1.1. Bloc de Code `SuperFences` MkDocs

Ce type de bloc de code permet de :

- coloriser syntaxiquement le code si un langage est indiqué : ````python`
- mettre en évidence des lignes ````hl_lines="2 3 10-15"` (lignes 2, 3 et de 10 à 15)
- numéroté les lignes ````linenums="5"` (numérotation des lignes commençant à 5)

Ces différentes options peuvent être combinées :

```
```python hl_lines="2 5-6" linenums="1"
#!/usr/bin/python
Note: see how to craft FEALIST in eternalblue_poc.
from impacket import smb
from struct import pack
import sys
import socket
```

Listing 3 - Syntaxe de code combinant les différentes options

```
1 #!/usr/bin/python
2 # Note: see how to craft FEALIST in eternalblue_poc.
3 from impacket import smb
4 from struct import pack
5 import sys
6 import socket
```

Listing 4 - Résultat de code combinant les différentes options

#### Note

Les lignes mises évidences sont en **rouge OSCP** dans le rendu PDF.

```

1 | #!/usr/bin/python
2 | # Note: see how to craft FEALIST in eternalblue_poc.
3 | from impacket import smb
4 | from struct import pack
5 | import sys
6 | import socket

```

### 2.1.1.1. La gestion des retours à la ligne

Le retour à la ligne dans les blocs de code non numérotés est automatique :

```

ntfea10000 = pack('<BBH', 0, 0, 0xffdd) + 'A'*0xffde

ntfea11000 = (pack('<BBH', 0, 0, 0) + '\x00')*600 # with these fea, ntfea size is
0x1c20
ntfea11000 += pack('<BBH', 0, 0, 0xf3bd) + 'A'*0xf3be # 0x10fe8 - 0x1c20 - 0xc =
0xf3bc

ntfea1f000 = (pack('<BBH', 0, 0, 0) + '\x00')*0x2494 # with these fea, ntfea size
is 0x1b6f0
ntfea1f000 += pack('<BBH', 0, 0, 0x48ed) + 'A'*0x48ee # 0x1ffe8 - 0x1b6f0 - 0xc =
0x48ec

```

Listing 5 - Bloc de code avec retour à ligne automatique

La propriété CSS correspondante est `white-space: pre-wrap; .`

#### Attention

La notion de retour à la ligne "doux" n'existant pas dans un document PDF, un copier/coller du code ne donnera pas le résultat attendu.

```

1 | ntfea10000 = pack('<BBH', 0, 0, 0xffdd) + 'A'*0xffde
2 |
3 | ntfea11000 = (pack('<BBH', 0, 0, 0) + '\x00')*600 # with these fea, ntfea size :
4 | ntfea11000 += pack('<BBH', 0, 0, 0xf3bd) + 'A'*0xf3be # 0x10fe8 - 0x1c20 - 0xc :
5 |
6 | ntfea1f000 = (pack('<BBH', 0, 0, 0) + '\x00')*0x2494 # with these fea, ntfea si:
7 | ntfea1f000 += pack('<BBH', 0, 0, 0x48ed) + 'A'*0x48ee # 0x1ffe8 - 0x1b6f0 - 0xc

```

Listing 6 - Bloc de code numéroté donc sans retour à ligne automatique

#### Remarque

La fonctionnalité n'est pas disponible pour les blocs de code numérotés car elle "casse" la numérotation des lignes aussi bien en rendu HTML qu'en rendu PDF.

## 2.1.2. Bloc de Code HTML MkDocs

Ce sont des blocs de code standard `HTML`, des éléments peuvent être mis en évidence en utilisant la balise `<mark>`.

### Note

Il est nécessaire de traduire les chevrons ouvrants en entité HTML `&lt;`; s'il peuvent être interprété comme l'ouverture d'une balise HTML (exemple en ligne 7).

```
1 <pre><code>
2 <mark>$ mkdocs serve</mark>
3 INFO - Building documentation...
4 INFO - Cleaning site directory
5 [I 160402 15:50:43 server:271] <mark>Serving on http://127.0.0.1:8000</mark>
6 [I 160402 15:50:43 handlers:58] Start watching changes
7 [I 160402 15:50:43 handlers:60] Start detecting changes <halt>
8 [I 160402 15:50:43 handlers:58] Start watching changes < halt>
9 [I 160402 15:50:43 handlers:60] Start detecting changes <halt>
10 </code></pre>
```

Listing 7 - Exemple d'un bloc de code HTML

```
$ mkdocs serve
INFO - Building documentation...
INFO - Cleaning site directory
[I 160402 15:50:43 server:271] Serving on http://127.0.0.1:8000
[I 160402 15:50:43 handlers:58] Start watching changes
[I 160402 15:50:43 handlers:60] Start detecting changes <halt>
[I 160402 15:50:43 handlers:58] Start watching changes < halt>
[I 160402 15:50:43 handlers:60] Start detecting changes
```

Listing 8 - Rendu d'un bloc de code HTML

## 2.2. Les blocs de Code HTML "OSCP"

### 2.2.1. Mise en évidence

Trois types de mise en évidence "OSCP" ( 2012-code-block ) sont disponibles en utilisant des balises spécifiques, les noms des balises correspondent à l'utilisation qui semblent en être faite dans le document de référence :

```
<pre><code>
kali@kali:~$ <oscp-cmd>searchsploit afd windows</oscp-cmd>
<oscp-parameter>local</oscp-parameter>
...
<oscp-hacked>Microsoft Windows XP/2003 | windows/local/6757.txt</oscp-hacked>
...
<!-- les anciennes balise mark + class oscp sont toujours disponibles-->
</code></pre>
```

Listing 9 - Exemple de mise en évidence d'une partie du listing

```
kali@kali:~$ searchsploit afd windows local
```

Exploit Title	Path
Microsoft Windows (x86) - 'afd.sys' Local Privilege Escalation	windows_x86/local/4
Microsoft Windows 7 (x86) - 'afd.sys' Dangling Pointer Privileg	windows_x86/local/3
Microsoft Windows XP - 'afd.sys' Local Kernel Denial of Service	windows/dos/17133.c
Microsoft Windows XP/2003 - 'afd.sys' Local Privilege Escalatio	windows/local/6757.
Microsoft Windows XP/2003 - 'afd.sys' Local Privilege Escalatio	windows/local/18176

```
Shellcodes: No Result
kali@kali:~$
```

Listing 10 - Résultat "OSCP"

### 2.2.2. Passage à la ligne

Le passage à la ligne n'est pas activé par défaut, car ce type de bloc de code est principalement utilisé pour illustrer le résultat de commande ; le passage à la ligne peut ne pas être le résultat attendu mais il est possible de l'activer à l'aide de la classe `fc-pdf-white-space-pre-wrap` :

```
<pre class="fc-pdf-white-space-pre-wrap"><code>
Most field in overwritten (corrupted) srvnet struct can be any value ...
```

Listing 11 - Exemple de bloc de code avec passage à la ligne forcée

Most field in overwritten (corrupted) srvnet struct can be any value because it will be left without free (memory leak) after processing

Here is the important fields on x64

- offset 0x58 (VOID\*) : pointer to a struct contained pointer to function. the pointer to function is called when done receiving SMB request.

The value MUST point to valid (might be fake) struct.

- offset 0x70 (MDL) : MDL for describe receiving SMB request buffer

- 0x70 (VOID\*) : MDL.Next should be NULL

- 0x78 (USHORT) : MDL.Size should be some value that not too small

- 0x7a (USHORT) : MDL.MdlFlags should be 0x1004 (MDL\_NETWORK\_HEADER|

MDL\_SOURCE\_IS\_NONPAGED\_POOL)

- 0x80 (VOID\*) : MDL.Process should be NULL

- 0x88 (VOID\*) : MDL.MappedSystemVa MUST be a received network buffer address. Controlling this value get arbitrary write.

The address for arbitrary write MUST be subtracted by a number of sent bytes (0x80 in this exploit).

Listing 12 - Résultat du passage à la ligne forcée

**Did I try enough harder? ;-)**
